December 11, 2021

21. Prove that $\tan 70^\circ, \tan 50^\circ + \tan 20^\circ, \tan 20^\circ$ are in A.P.

Solution:

$$\begin{split} \tan 70^\circ &= \tan (50^\circ + 20^\circ) = \frac{\tan 50^\circ + \tan 20^\circ}{1 - \tan 50^\circ \tan 20^\circ} \\ \tan 70^\circ - \tan 70^\circ \tan 50^\circ \tan 20^\circ = \tan 50^\circ + \tan 20^\circ \\ &\because \tan 70^\circ . \tan 20^\circ = \tan 70^\circ \cot 70^\circ = 1 \\ &\Rightarrow \tan 70^\circ = \tan 20^\circ + 2\tan 50^\circ \end{split}$$

Thus, $\tan 70^{\circ}$, $\tan 50^{\circ} + \tan 20^{\circ}$, $\tan 20^{\circ}$ are in A.P. with common difference of $\tan 50^{\circ}$.

22. If $\log_l x, \log_m x, \log_n x$ are in A.P. and $x \neq 1$, prove that $n^2 = (nl)^{\log_l m}$

Solution: $\because \log_l x, \log_m x, \log_n x$ are in A.P.

$$\begin{split} 2\log_m x &= \log_l x + \log_n x \Rightarrow 2\frac{\log x}{\log m} = \frac{\log x}{\log l} + \frac{\log x}{\log n} \\ &\Rightarrow \frac{2}{\log m} = \frac{\log n l}{\log l \log n} \Rightarrow 2\log n = \log n l \log_l m \\ &\Rightarrow \log n^2 = \log(n l)^{\log_l m} \end{split}$$

Taking anti-log $n^2 = (nl)^{\log_l m}$

23. The length of sides of a right angled triangle are in A.P., show that their ratio is 3:4:5

Solution: Let the sides are a, a+d, a+2d of the right angled triangle. Clearly, a+2d is largest and hence hypotenuse. Thus, we can write

$$(a+2d)^2 = a^2 + (a+d^2) \Rightarrow a^2 - 2ad - 3d^2 = 0 \Rightarrow a = -d, a = 3d$$

However, a side cannot be -ve so a=3d and hence ratio of sides are 3:4:5

24. If $\log_3 2, \log_3(2^x-5), \log_3\left(2^x-\frac{7}{2}\right)$ are in A.P., determine the value of x.

Solution: $\cdot \cdot \log_3 2, \log_3(2^x - 5), \log_3\left(2^x - \frac{7}{2}\right)$ are in A.P.

$$\begin{split} \log_3(2^x - 5) - \log_3 2 &= \log_3\left(2^x - \frac{7}{2}\right) - \log_3(2^x - 5) \\ (2^x - 5)^2 &= 2\left(2^x - \frac{7}{2}\right) \Rightarrow 2^{2x} - 12.2^x + 32 = 0 \\ 2^x &= 8.4 \Rightarrow x = 3.2 \end{split}$$

However, if $d=2,2^x-5<0$ and logarithm of that wont be real. Thus, x=3

25. Find the values of a for which $5^{1+x}+5^{1-x}, \frac{a}{2}, 25^x+25^{-x}$ are in A.P.

Solution:

$$a = 5^{1+x} + 5^{1-x} + 25^x + 25^{-x} = 5(5^x + 5^{-x}) + 25^x + 25^{-x} \ge 5.2 + 2 = 12$$

This solution used the fact that for real no. $x + \frac{1}{x} \ge 2$ which can be proved trivially.

26. If $\log 2, \log(2^x-1)$ and $\log(2^x+3)$ are in A.P., then find x.

Solution:

$$\log(2^x - 1) - \log 2 = \log(2^x + 3) - \log(2^x - 1) \Rightarrow (2^x - 1)^2 = 2(2^x + 3)$$
$$2^{2x} - 4 \cdot 2^x - 5 = 0 \Rightarrow 2^x = -1, 5$$

However, for real $x, 2^x$ cannot be -1. Thus, $x = \log_2 5$ is the solution.

27. If $1, \log_y x, \log_z y, -15 \log_x z$ are in A.P., then prove that $x = z^3$ and $y = z^{-3}$

Solution: Let d be the common difference of the A.P. Then,

$$\label{eq:def} \cdot \cdot \cdot d = -2[\cdot \cdot 6d^2 - d + 8 = 0 \text{ has complex roots.}]$$

$$\therefore x=z^3, y=z^{-3}$$

28. Show that $\sqrt{2}, \sqrt{3}, \sqrt{5}$ cannot be terms of a single A.P.

Solution: Let $\sqrt{2},\sqrt{3},\sqrt{5}$ be pth, qth and rth term of an A.P. Then,

$$\frac{\sqrt{5}-\sqrt{3}}{\sqrt{3}-\sqrt{2}} = \frac{r-q}{q-p} = k$$

Since p, q, r are integers therefore k will be a rational number.

$$\sqrt{5}-\sqrt{3}=k(\sqrt{3}-\sqrt{2})$$

Squaring, we get

$$5+3-2\sqrt{15} = k(3+2-2\sqrt{6})$$

$$k = \frac{8-2\sqrt{15}}{5-2\sqrt{6}}$$

Multiplying both numberator and denominator with $5+2\sqrt{6}$, we obtain that k is not a rational number. Thus, we have proved the required condition.

29. A circle of one centimeter radius is drawn on a piece of paper and with the same center 3n-1 other circles are drawn of radii 2 cm, 3 cm, 4 cm and so on. The inner circle is painted blue, the ring between that and next circle is painted red, the next ring yellow then other rings blue, red, yellow and so on in this order. Show that the successive aread of each color are in A.P.

Solution: The blue color circles will have radius of $1, 4, 7, 10, \dots, 3n-2$ cm each.

So the areas of blue rings are
$$\pi.1^2, \pi(4^2-3^2), \pi(7^2-6^2), \dots, \pi[(3n-2)^2-(3n-3)^2]$$

$$\pi[(3n-2)^2-(3n-3)^2]=\pi(6n-5)$$
 which is t_n and forms an A.P. with common ratio 6

Similarly, it can be shown that red and yellow rings form an A.P.

30. If $x, y, z(x, y, z \neq 0)$ are in A.P. and $\tan^{-1} x, \tan^{-1} y, \tan^{-1} z$ are also in A.P., then prove that x = y = z

Solution: Since x, y, z are in A.P. 2y = x + z Similarly,

$$2 \tan^{-1} y = \tan^{-1} x + \tan^{-1} z$$

$$2 \tan^{-1} y = \tan^{-1} \frac{x+z}{1-xz}$$

$$\tan(2 \tan^{-1} y) = \frac{x+z}{1-xz}$$

$$\frac{2y}{1-y^2} = \frac{x+z}{1-xz}$$

$$(x+z) \left[\frac{1}{1-y^2} - \frac{1}{1-xz} = 0 \right]$$

$$\Rightarrow y^2 = xz$$

So x, y, z are in G.P. as well. Thus,

$$4y^2 = x^2 + z^2 + 2xz = x^2 + z^2 + 2y^2 \Rightarrow x^2 + z^2 - 2xz = 0 \Rightarrow x = z \Rightarrow x = y = z$$
