March 19, 2023

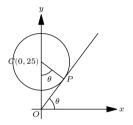

191. If $z-6-8i \le 4$, then find the least and greatest value of z.

Solution:
$$|z - 6 - 8i| \le |4| \Rightarrow -4 \le ||z| - |6 + 8i|| \le 4$$

$$\Rightarrow -4 \leq |z| - 10 \leq 10 \Rightarrow 6 \leq |z| \leq 14$$

192. If $z-25i \leq 15$ then find the least positive value of $\arg(z)$.

Solution: The diagram is given below:

Given $z - 26 \le 15$, which represents a circle having center (025) and a radius 15.

Let OP be tangent to the circle at point P, then $\angle XOP$ will represent least value of $\arg(z)$.

Let
$$\angle XOP = \theta$$
 then $\angle OCP = \theta$. Now $OC = 25, CP = 15 : OP = 20$

$$\therefore \tan \theta = \frac{OP}{CP} = \frac{4}{3}$$
. \therefore Least value of $\arg(z) = \theta = \tan^{-1} \frac{4}{3}$

193. Show that the equation $|z-z_1|^2+|z-z_2|^2=k$ where $k\in R$ will represent a circle if $k\geq \frac{1}{2}|z_1-z_2|^2$.

$$\begin{split} &\textbf{193. Given,} \ |z-z_1|^2 + |z-z_2|^2 = k \\ &\Rightarrow |z|^2 + |z_1|^2 - 2z\overline{z_1} + |z|^2 + |z_2|^2 - 2z\overline{z_2} = k \\ &\Rightarrow 2|z|^2 - 2z(\overline{z_1} + \overline{z_2}) = k - (|z_1|^2 + |z_2|^2) \\ &\Rightarrow |z|^2 - 2z\left(\frac{\overline{z_1} + \overline{z_2}}{2}\right) + \frac{1}{4}|z_1 + z_2|^2 = \frac{k}{2} + \frac{1}{4}[|z_1 + z_2|^2 - 2|z_1|^2 - 2|z_2|^2] \\ &\Rightarrow |z - \frac{z_1 + z_2}{2}|^2 = \frac{1}{2}\left[k - \frac{1}{2}|z_1 - z_2|^2\right] \end{split}$$

The above equation represents a circle with center at $\frac{z_1+z_2}{2}$ and radius $\frac{1}{2}\sqrt{2k-|z_1-z_2|^2}$ provided $k\geq \frac{|z_1-z_2|^2}{2}$.

194. If
$$|z-1|=1$$
, prove that $\frac{z-2}{z}=i\tan[\arg(z)].$

Solution: Since |z-1|=1, z represents a circle with center (1,0) and a radius of of 1. It is shown below:

Now |z - 1| = 1. Let z = x + iy then $x^2 + y^2 = 2x$. Also,

$$\frac{z-2}{z} = \frac{x-2+iy}{x+iy} = \frac{x^2-2x+y^2+2iy}{x^2+y^2} = i\frac{y}{x}$$

Case I. When z lies in the first quadrant. This implies $\arg(z)=\theta$, where $\tan\theta=\frac{y}{x}$: $i\tan[\arg(z)]=i\tan\theta=i\frac{y}{x}$.

Case II. When z lies in the fourth quadrant. Thus, $\arg(z)=2\pi-\theta$, where $\tan\theta=\frac{-y}{x}$

$$i \tan[\arg(z)] = i \tan(2\pi - \theta) = i \frac{y}{x}.$$

195. Findthe local of z if $\arg\left(\frac{z-1}{z+1}\right) = \frac{\pi}{4}$.

Solution: Let
$$z=x+iy$$
. Now we have $\frac{z-1}{z+1}=\frac{(x^2-1)+y^2}{(x+1)^2+y^2}+i\frac{2y}{(x+1)^2+y^2}$

$$\therefore \arg\left(\frac{z-1}{z+1}\right) = \frac{\pi}{4} \Rightarrow \tan\left(\arg\left(\frac{z-1}{z+1}\right)\right) = \frac{2y}{x^2-1+y^2}$$

$$\Rightarrow x^2+y^2-1-2y=0 \Rightarrow x^2+(y-1)^2=2 \text{, which is equation of a circle having center at } (0,1) \text{ and radius } \sqrt{2}.$$

196. If α is real and z is a complex number and u and v be the real and imaginary parts of $(z-1)(\cos\alpha-i\sin\alpha)+(z-1)^{-1}(\cos\alpha+i\sin\alpha)$. Prove that the locus of the points representing the complex numbers such that v=0 is a circl of unit radius with center at a point (1,0) and a straight line passing through the center of the circle.

$$\begin{aligned} & \textbf{Solution: Let } z = x+iy. \ \ \textbf{Now, } u+iv = (z-1)(\cos\alpha-i\sin\alpha) + \frac{1}{z-1}(\cos\alpha+i\sin\alpha) \\ & = (x-1)\cos\alpha + y\sin\alpha + i[y\cos\alpha-(x-1)\sin\alpha] + \frac{x-1-iy}{(x-1)^2+y^2}(\cos\alpha+i\sin\alpha) = 0 \end{aligned}$$

Equating imaginary parts, we get

$$v=y\cos\alpha-(x-1)\sin\alpha+\tfrac{(x-1)\sin\alpha-y\cos\alpha}{(x-1)^2+y^2}=0\Rightarrow[y\cos\alpha-(x-1)\sin\alpha][(x-1)^2+y^2]=0$$

 \therefore Either $y\cos\alpha-(x-1)\sin\alpha=0 \Rightarrow y=\tan\alpha(x-1)$, which is a straight line passing through (1,0) or $(x-1)^2+y^2-1=0$ which is a circle with center (1,0) and unit radius.

197. If $|a_n|<2$ for n=1,2,3,... and $1+a_1z+a_2z^2+\cdots+a_nz^n=0$, show that z does not lie in the interior of the circle $|z|=\frac{1}{3}$.

197. Given,
$$1+a_1z+a_2z^2+\cdots+a_nz^n=0 \Rightarrow |a_1z|+|a_2z^2|+\cdots+|a_nz^b|\geq 1$$
 and

$$\mathsf{L.H.S.} < 2|z| + 2|z|^2 + \cdots \mathsf{to} \ \infty[\because |a_n|] < 2.$$

Let
$$|z|<1$$
 then $\frac{2|z|}{1-|z|}<1\Rightarrow |z|>\frac{1}{3}$

When |z|>1, clearly $|z|>\frac{1}{3}$; hence, z does not lie in the interior of the circle with radius $\frac{1}{3}$.

198. Show that all the roots of the equation $z^n\cos\theta_0+z^{n-1}\cos\theta_1+\cdots+\cos\theta_n=2$, where $\theta_0,\theta_1,\ldots,\theta_n\in R$ lie outside the circle $|z|=\frac{1}{2}$.

$$\begin{split} & \textbf{Solution: Given,} \ z^n \cos \theta_0 + z^{n-1} \cos \theta_1 + \dots + \cos \theta_n = 2 \\ & \Rightarrow 2 = |z^n \cos \theta_0 + z^{n-1} \cos \theta_1 + \dots + \cos \theta_n| \\ & < |z^n \cos \theta_0| + |z^{n-1} \cos \theta_1| + \dots + |\cos \theta_n| \\ & = |z^n||\cos \theta_0| + |z^{n-1}||\cos \theta_1| + \dots + |\cos \theta_n| \\ & \leq |z|^n + |z|^{n-1} + \dots + 1 < 1 + |z| + |z|^2 + \dots \textbf{to} \ \infty \\ & \Rightarrow 2 = \frac{1}{1-|z|} \Rightarrow |z| > \frac{1}{2} [\ \textbf{when} \ |z| < 1] \end{split}$$

Hence z lies outside the circle $|z| = \frac{1}{2}$.

Thus all roots of the given equation lie outside the circle $|z| = \frac{1}{2}$.

199. z_1, z_2, z_3 are non-zero, non-collinear complex numbers such that $\frac{2}{z_1} = \frac{1}{z_2} + \frac{1}{z_3}$. Show that z_1, z_2, z_3 lie on a circle passing through origin.

Solution: Recall that points z_1, z_2, z_3 are concyclic if $\left(\frac{z_2-z_4}{z_1-z_4}\right)\left(\frac{z_1-z_3}{z_2-z_3}\right)$ is real. We assume that z_4 is origin.

Given,
$$\frac{2}{z_1}=\frac{1}{z_2}+\frac{1}{z_3}=\frac{z_2+z_3}{z_2z_3}$$
 $\dot{\cdot}z_1=\frac{2z_2z_3}{z_1+z_3}.$

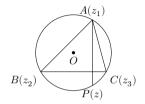

Putting the value of z_1 and z_4 in the concyclic condition expression we obtain

$$\left(\frac{z_2-z_4}{z_1-z_4}\right)\left(\frac{z_1-z_3}{z_2-z_3}\right) = \frac{1}{2}.$$

Thus, z_1, z_2, z_3 lie on a circle passing through origin.

200. A,B,C are the points representing the complex numbers z_1,z_2,z_3 respectively on the complex plane and the circumcenter of the $\triangle ABC$ lies on the origin. If the altitude of the triangle through vertex A meets the circle again at P, prove that P represents the complex number $\frac{z_2z_3}{z_1}$.

Solution: The origin O is the circumcenter of $\triangle ABC$ and AP is perpendiculse to BC. Let P=z.

We have
$$OP = OA = OB = OC$$
: $|z| = |z_1| = |z_2| = |z_3| \Rightarrow |z|^2 = |z_1|^2 = |z_2|^2 = |z_3|^2 \Rightarrow z\overline{z} = z_1\overline{z_1} = z\overline{z_2} = z\overline{z_3}$.

Since AP is perpendicular to BC, therefore

$$\arg\left(rac{z_1-z}{z_2-z_3}
ight)=rac{\pi}{2} ext{ or } rac{-\pi}{2} \Rightarrow rac{z_1-z}{z_2-z_3} ext{ is purely imaginary.}$$

$$\Rightarrow \overline{\left(\frac{z_1-z}{z_2-z_3}\right)} = -\frac{z_1-z}{z_2-z_3}$$

Solving the above equation gives $z=rac{z_2z_3}{z_1}$.
